IMRAN RASHEED

Senior Software Engineer (Full Stack) · AI / LLM Evaluation & Agent Tooling

Lahore, Pakistan • Remote, Full Time • 4+ hrs daily US Timezone Overlap (EST / PST) • Fluent English

imranrasheed.developer@gmail.com | +92 308 4706656 | LinkedIn | GitHub

PROFESSIONAL SUMMARY

Senior Software Engineer (Full Stack) with 8 years of experience since 2018 across AI advancement and application engineering work: LLM post training and evaluation infrastructure, enterprise ERP systems, and cloud microservices. Currently at Turing, building the engineering tooling behind LLM and coding agent evaluation programs for frontier AI labs and enterprise clients, spanning SWE-Bench and SWE-Bench+ tooling and dataset curation, code interpreter and function calling evaluation, and code translation between Swift and Python. Polyglot across Python, TypeScript, JavaScript, Java, PHP, and Swift, with production depth in Node.js (NestJS), React.js, Vue.js, Docker, PostgreSQL, MySQL, and AWS. Owns work end to end, from benchmark data quality through to shipped product features, and is a daily user of AI assisted development workflows including Cursor, GitHub Copilot, and Claude Code.

CORE TECHNICAL SKILLS

- **Languages (years):** JavaScript (8), PHP (8), SQL (8), TypeScript (6), Python (5), Java (2), Swift (2), C++, Bash, HTML5/CSS3
- **AI, LLM & Agent Engineering:** LLM post training data workflows covering SFT and RLHF style generation, review and evaluation; model evaluation and benchmarking; SWE-Bench, SWE-Bench+ and SWE-Bench++ tooling and dataset curation; coding agent evaluation harnesses; agentic workflows; tool use and function calling; Model Context Protocol (MCP); code interpreter execution sandboxes; code translation between Swift and Python; prompt and rubric design; human in the loop QA with automated pre checks; synthetic data generation
- **Backend Engineering:** Node.js (8 yrs; NestJS v11, Express), Laravel (8 yrs), Python (FastAPI, scripting and automation), REST, GraphQL and streaming APIs, microservices, JWT, Passport, OAuth 2.0, RBAC, WireGuard protocol
- **Frontend Engineering:** React.js (6 yrs), Vue.js (6 yrs; Composition API), Next.js, Vite, Tailwind CSS, Redux, Vuex, VS Code and browser extension development
- **Data & Caching:** PostgreSQL, MySQL, MongoDB, Redis, Sequelize ORM, Prisma, schema design, indexing, query optimization
- **DevOps, Cloud & Monitoring:** Docker and Docker Compose, reproducible containerized environments, AWS (EC2, S3, RDS, Lambda, CloudWatch), Azure, CI/CD with GitHub Actions, Prometheus metrics, structured logging, Nginx, shell scripting
- **AI Assisted Development:** Cursor, GitHub Copilot and Copilot Agent, Claude Code, Ollama and local LLM runtimes, MCP server configuration, Google Gemini and Groq APIs
- **Practices:** Test Driven Development, code review, technical mentoring, separation of concerns, type safety, Agile and Scrum, async remote collaboration across US timezones

PROFESSIONAL EXPERIENCE

Senior Full Stack Engineer / Team Lead | Turing, Remote | *July 2024 to Present*

Programs: *SWE-Bench+ Tooling · SWE-Bench Data · Penguin Code Translation · Penguin Code Interpreter · Penguin GUI · Penguin Function Calling · MCP · Microsoft Code Evaluation · Microsoft Codeforces*

- Build and maintain internal engineering tooling that powers large scale LLM post training and coding agent evaluation programs, working across **Python, JavaScript, TypeScript, Java, and Swift** codebases for frontier AI labs and enterprise clients including Microsoft.
- **SWE-Bench+ Tooling:** developed the evaluation tooling used to run, validate, and score coding agent benchmarks end to end, covering automated task setup, patch application, test execution, failure triage, and structured result reporting, which cut manual benchmark run effort substantially.
- **SWE-Bench Data:** curated and validated benchmark task data at scale, including issue selection, gold patch and fail to pass test verification, and environment reproducibility, and authored per repository Dockerized environments so agent runs are deterministic and independently repeatable.
- **Penguin Code Translation:** built code translation workflows converting **Swift to Python and Python to Swift**, with automated equivalence checks, test harness porting, and side by side output comparison to verify behavioural parity.
- **Penguin Code Interpreter and GUI:** contributed to sandboxed code execution flows and interactive GUI evaluation harnesses used to benchmark model reasoning, multi step problem solving, and stateful tool interaction.
- **Penguin Function Calling:** designed and validated structured function calling and tool use task formats, including JSON schema argument validation and automated grading of multi turn tool orchestration.
- **MCP:** implemented Model Context Protocol integrations that connect internal evaluation tooling, repositories, and data sources to LLM agents through a standardized interface.
- **Trainer Tooling and Extensions:** shipped internal extensions and automated pre check pipelines that validate trainer submissions before human review, catching schema, build, lint, and test failures up front, which significantly reduced task completion effort, review cycles, and downstream rework.
- **Microsoft Code Evaluation and Codeforces:** delivered evaluation tooling and competitive programming task pipelines with automated correctness grading, edge case and time limit validation, and structured scoring output.
- Raised data quality and throughput across programs through automated QA gates, rubric based review checklists, and reusable task templates, improving first pass acceptance rates and reducing reviewer load.

- Act as team lead by onboarding and mentoring engineers and trainers, running code review across submissions, resolving blockers across the US and PKT overlap, and scoping client requirements into deliverable engineering work.
- Architected scalable microservices in **Node.js, Python, and Laravel** supporting AI evaluation and fine tuning workflows, and built responsive React.js and Vue.js dashboards that process large asynchronous data payloads for evaluation and reporting.
- Accelerated feature delivery velocity by **35%** by embedding AI assisted development tools such as Cursor and GitHub Copilot into daily sprints, containerizing application layers with Docker, automating CI/CD across AWS EC2 and S3, and reducing system latency through database indexing, Redis caching, and asynchronous task queues.

Full Stack Developer (Frontend Focused) | Coregenion GmbH, Remote | *Feb 2023 to June 2024*

- Rebuilt and modernized modular frontend architectures using React.js and Vue.js for real time KPI processing and analytics dashboards.
- Integrated high performance Node.js and Laravel APIs, reducing network latency and improving frontend and backend payload maintainability.
- Introduced global state management with Redux and Vuex plus client side caching strategies to ensure fluid rendering of data heavy administrative views.
- Managed containerized instances and scaled AWS cloud infrastructure to support high concurrent user traffic.

Full Stack Developer | Glorek, Lahore, Pakistan | *June 2021 to Dec 2022*

- Designed and delivered an **end to end enterprise ERP system** from scratch, covering inventory, procurement, sales, HR, and financial modules, owning database design, backend services, and frontend implementation as a core member of a small product team.
- Built the ERP backend as a modular, multi tenant platform with strict separation of concerns, enforcing data integrity across financial and user modules through request validation and centralized error handling guards.
- Implemented a granular **Role Based Access Control** security layer with dynamic permission resolution, JWT authentication, and bcrypt password hashing, supporting distinct permission sets per organization and role.
- Developed the ERP frontend in Vue.js with reusable component libraries and global state management, delivering data heavy operational dashboards used daily by internal teams.
- Extended the platform with a health and wellness marketplace backend in Node.js covering dynamic matching, hiring workflows, and coach to client state tracking, modelled the underlying MySQL schemas, and set up deployment, backup, and monitoring routines for production instances.

Backend Engineer (APIs & Cloud Services) | ITRID Technologies, Lahore, Pakistan | *March 2018 to May 2021*

- Developed and maintained enterprise grade REST APIs using Laravel and Express.js, serving thousands of concurrent requests.
- Refactored monolithic legacy systems into modular, decoupled microservices, increasing application fault tolerance and maintenance efficiency.
- Optimized complex database schemas and query execution paths in MySQL and PostgreSQL to reduce query latency, and implemented role based access control, JWT authentication, and automated error handling layers across shared service modules.

OPEN SOURCE & PERSONAL PROJECTS

SeekRemoteJobs, AI Powered Remote Job Aggregation Platform | seekremotejobs.com | GitHub

- Built and shipped a live full stack platform that aggregates postings from over 40 top tech company career pages into one searchable interface, using React with Vite on the frontend and Node.js with Express and PostgreSQL on the backend.
- Engineered the crawling layer with Puppeteer and a reusable browser pool alongside Greenhouse, Lever, and Workable API integrations, with parallel crawling, incremental updates, and deduplication.
- Added AI features using Google Gemini and Groq for resume parsing, resume tailoring, ATS score analysis, cover letter generation, and job matching, with PDF parsing and secure file upload handling.
- Implemented JWT and Google OAuth 2.0 authentication with bcrypt hashing, email verification, and role based access control, and deployed with Docker Compose behind Nginx using indexed PostgreSQL full text search, pagination, GZIP compression, and rate limiting.

ModelVault MiniVault API, AI Streaming and Local LLMs | GitHub

- Built a lightweight, high performance REST API simulating core LLM prompt and response mechanics with real time token streaming and JSON endpoints.
- Integrated local LLM capabilities via Ollama alongside an automated bootstrapping layer in bash and PowerShell to vendor CLI configs and spin up Docker instances.
- Embedded production monitoring by exposing real time Prometheus metrics, structured JSONL logging, and interactive testing via a custom Python CLI.

SecureNest VPN Cloud Infrastructure and System Utilities | GitHub

- Developed the backend architecture for a secure VPN service, managing network routing, handshake validation, and secure infrastructure bridges using the WireGuard protocol.
- Authored a low level computer vision utility in C++ for real time motion detection, showing deep memory management and efficient algorithmic processing.

EDUCATION & CERTIFICATIONS

- **B.Sc. in Software Engineering**, University of Management and Technology, Lahore (2015 to 2019) • **freeCodeCamp**: JavaScript Algorithms and Data Structures; Responsive Web Design
